ABSTRACT

--A bait station for use in the elimination of termites when detected comprises a hollow body having a plurality of apertures therein and occupying substantially the entire interior of the hollow body in a cellulosic matrix containing a termiticide. The bait station is adapted for attachment to a detector station or a termite infested structure via an exposable aperture by a communicator tube extending between an interior region of said bait station and an interior region of said detector station or said structure to provide a termite pathway between said cellulosic matrix and a termite colony.--
